RE: Shelf Life of CPI Lubricants

To whom it may concern:

The shelf life for CPI oil, where it has been stored in normal conditions, is specified as indefinite with recommended re-test date of 4 years. Normal conditions are taken to be containers stored unopened and under cover and not exposed to extremes of temperature. The expectation is that the oil will be of acceptable quality for much longer than 4 years but the manufacturer recommends sample testing to confirm that it is still within specifications after the 4 years mark.

Lubricant oils should be kept sealed in storage prior to use in an OEM approved system. CPI cannot comment on shelf life of non-sealed lubricant.

Yours faithfully,

Mitch Corner
